Overview: Mounting ADLS to DBFS

Mounting ADLS to DBFS

- **Register an Azure AD application to create a service principal:** service principle is a security identity used to access specific azure resources (It is similar to a user identity with a specific role such as a contributor for a specific resource)
- When we create the service principle then we get an application client ID, an application, tenant ID, and a client secret
- **Give the service principal 'contributor' access to ADLS**
- **Mount ADLS to DBFS using the IDs and secret**

THANK YOU
